Calculate the radius of gyration for the shaded area shown with respect to an axis that passes through the centroid of the area and normal to the plane of the area. 

\[ y = \frac{x^2}{2b} \]

The axis in question is the centroidal \(z\)-axis. The easiest way to calculate this value is with the following relationship:

\[ I_z = I_x + I_y \]

Because the shaded area is a parabolic spandrel of the form 

\[ y = kx^2 \]

then formulas developed for parabolic spandrels will be used.
These results are summarized as follows:

\[ y = kx^2 \]

\[ A = \frac{bh}{3} \]
\[ \bar{x} = \frac{2b}{3} h \]
\[ \bar{y} = \frac{3b}{10} h \]

\[ I_x = \frac{bh^3}{24} \]
\[ I_y = \frac{hb^3}{5} \]

Calculated in previous examples.

In the current case, \( b = 0 \) and \( h = \frac{b}{2} \).

Therefore,

\[ A = \frac{bh}{w} = \frac{b \cdot \frac{b}{2}}{3} = \frac{b^2}{6} \]
(3) \[ X = \frac{3}{4} b \]

(4) \[ y = \frac{3}{10} h = \frac{3}{10} \frac{b}{2} = \frac{3}{20} b \]

(5) \[ I_x = \frac{b h^3}{12} = \frac{b (\frac{b}{2})^3}{12} = \frac{b^4}{168} \]

(6) \[ I_y = \frac{b h^3}{6} = \frac{b (\frac{b}{2})^3}{6} = \frac{b^4}{10} \]

Then \( I_x \) and \( I_y \) are calculated with the parallel axis theorem as follows.
\[
\begin{align*}
T_x &= T_x + A \cdot d^2 \\
(7) \quad I_x &= \frac{b^4}{16} + \frac{b^2}{c} \left(\frac{3}{20}b\right)^2 \\
(8) \quad I_x &= \frac{b^4}{16} - \frac{9b^4}{2400} \\
(9) \quad I_x &= \frac{b^4}{16,800} \left[100 - 63\right] \\
(10) \quad I_x &= \frac{37b^4}{16,800} \\
(11) \quad I_y &= T_y + A \cdot d^2 \\
(12) \quad I_y &= \frac{b^4}{10} + \frac{b^2}{c} \left(\frac{3}{4}b\right)^2 \\
(13) \quad I_y &= \frac{b^4}{10} - \frac{9b^4}{76} \\
(14) \quad I_y &= \frac{b^4}{960} \left[96 - 90\right] \\
(15) \quad I_y &= \frac{6b^4}{960} \\
(16) \quad I_y &= \frac{6b^4}{160} \\
(17) \quad I_y &= \frac{6b^4}{160}
\end{align*}
\]
